These signals can be described with the help of probability and other concepts in statistics. Particularly the signal under observation is considered as a realization of a random process or a stochastic process. The terms random processes, stochastic processes and random signals are used synonymously.

PROBABILITY THEORY AND STOCHASTIC PROCESS

In probability theoryand related fields, a stochasticor random processis a mathematical objectusually defined as a familyof random variables. Many stochastic processes can be represented by time series. However, a stochastic process is by nature continuous while a time series is a set of observations indexed by integers.

A stochastic integral is defined in the sense of convergence in probability and gives a sufficient condition for its existence. A process  $X(t)$  is said to be homogeneous if the distribution function of the increment  $X(t + \Delta t) - X(t)$  depends only on the length  $\Delta t$  of the interval but is independent of the endpoint  $t$ .
