Safeguards Group at Oak Ridge National Laboratory (ORNL) installed and commissioned a Platform Scale Testing Center designed to investigate the accuracy and performance capabilities of a variety of load cell weighing systems. Installed at the National Transportation Research Center, this test facility currently

consists of two platform scales that mimic the size, capacity, and function of weighing systems used in a uranium hexafluoride product withdrawal station. The facility provides ORNL with the ability to investigate various operational scenarios. It also provides a means to simulate full weight profiles not

previously obtainable from the existing small-scale mock feed and withdrawal system. Each scale consists of a top weigh frame that is mounted to load cells in each corner. The load cells are connected to a weighing indicator that contains one or more analog-to-digital converters and reports the weight value in engineering

units. For industrial scales of this type, the National Institute of Standards and Technology (NIST) Handbook 44 standard error specification is 0.2% (of the load on the scale) or better. Two different commissioning tests were conducted on each scale, an increasing and decreasing test and a shift test. These tests were

conducted as described by the NIST Handbook 44 weighing system standard. These tests allowed ORNL staff to (1) ensure that the scales were functioning properly, (2) determine each scale's general accuracy, (3) evaluate the scale's hysteresis and nonlinearity, and (4) address concerns that uneven load

distribution could cause erroneous readings. The first scale was designed and manufactured by Eagle Microsystems. It has a size of 5' × 9 ft and has a capacity of 17,637 lb (8,000 kg). This scale is fitted with one shear-beam load cell in each corner. The scale was calibrated and tested first with an EI-4000 weighing indicator,

custom designed by Eagle Microsystems to display weight on each load cell independently as well as a total weight.

Afterwards, this scale was recalibrated and tested with an off-the-shelf Mettler Toledo junction box and Ohaus CD-33 weighing indicator. A second scale was designed and manufactured by Carton Scale. It is 5

× 10 ft and has a capacity of 10,000 lb (4,536 kg). This scale is fitted with a weigh module in each corner. Each weigh module has two load cells stacked on top of one another allowing the Carlton scale to connect to two different weighing indicators at the same time, providing separate, simultaneous weight readings.

One set of load cells was calibrated and tested with a Mettler Toledo junction box and IND-560 weighing indicator. The second set of load cells was calibrated and tested with each load cell wired to a separate analog card in a Mettler Toledo IND-780 weighing indicator, which displayed the weight from each load cell

independently as well as a total weight. The most important findings of the commissioning tests were that the scales performed best when calibrated using a standard span calibration method and in general were robust against uneven load distribution and did not demonstrate significant hysteresis or nonlinearity.

# Get Free Mettler Toledo Ind780 User Manual

When calibrated using the standard span calibration method, the Eagle Microsystems scale demonstrated an average total error of 0.025% and the Carlton scale 0.015%, both well within NIST standards of 0.2%. The errors caused by uneven load distribution were only slightly higher than the error with an

even load distribution. An additional test was conducted to address a question regarding the scales response when a single load cell was disconnected from the weighing indicator while the weight reading was taken. With a load cell disconnected, an average error of 0.59% was demonstrated when the weight was

evenly distributed on the scale. When the weight was unevenly distributed, an average error of 5.1% was demonstrated. Most importantly, this test showed that anomalies in the weight da ...

or not you are interested in martial arts, T'ai-Chi principles of balance can be applied to any life activity to increase performance, efficiency, health and enjoyment. T'AI-CHI FOR GENIUSES is a practice companion, not an instructional training manual. Rather than presuming that the reader is a "dummy" or "complete

Burnett encourages the reader to listen to this inner genius while he breaks down the often confusing and mysterious T'ai-Chi training into four

Once again keeping a keen ear to the needs of the evolving calculus community, Stewart created this text at the suggestion and with the collaboration of professors in the mathematics department at Texas A&M University. With an early introduction to vectors and vector

functions, the approach is ideal for engineering students who use vectors early in their curriculum. Stewart begins by introducing vectors in Chapter 1, along with their basic operations, such as addition, scalar multiplication, and dot product. The definition of vector functions and parametric curves is given at the end

of Chapter 1 using a two-dimensional trajectory of a projectile as motivation. Limits, derivatives, and integrals of vector functions are interwoven throughout the subsequent chapters. As with the other texts in his Calculus series, in *Early Vectors* Stewart makes us of heuristic examples to reveal calculus to students.

His examples stand out because they are not just models for problem solving or a means of demonstrating techniques - they also encourage students to develop an analytic view of the subject. This heuristic or discovery approach in the examples give students an intuitive feeling for analysis.
