Following are the main operations of transaction: Read(X): Read operation is used to read the value of X from the database and stores it in a buffer in main memory. Write(X): Write operation is used to write the value back to the database from the buffer. Let's take an example to debit transaction from an account which consists of following operations:

DBMS Transaction Processing Concept - javatpoint

Description. Transaction processing is designed to maintain a system's Integrity (typically a database or some modern filesystems) in a known, consistent state, by ensuring that interdependent operations on the system are either all completed successfully or all canceled successfully.. For example, consider a typical banking transaction that involves moving \$700 from a customer's savings ...
