The broken bone needs to be realigned (reduction). This can be done either through surgery (open reduction) or by force (closed reduction). Surgery involves fixation (internal or external) is used for unstable and complicated fractures. Closed reduction techniques are known as conservative treatments and are applied to stable and simple fractures.

Fracture Treatment - Physiotherapy - Treatments - Physio.co.uk

Add to that the common use of immobilisation in plaster, you'll have joint stiffness and considerable muscle weakness. It is common for non-fractured joints and muscle requiring rehabilitation. For example, a fractured shoulder may result in a very stiff elbow or wrist just because you were keeping your shoulder in a sling for a few weeks.

Hip fractures are usually treated in hospital with surgery. Most people will need surgery to fix the fracture or replace all or part of their hip, ideally on the same day they're admitted to hospital, or the day after. There are different operations, which are described below. The type of surgery you have will depend on:

Hip fracture - Treatment - NHS

Stress fractures account for between 1% and 20% of athletic injuries, with 80% of stress fractures in the lower extremity. Stress fractures of the lower extremity are common injuries among individuals who participate in endurance, high load-bearing activities such as running, military and aerobic exercise and therefore require practitioner expertise in diagnosis and management.
