Furthermore, collecting CO from the yeast is a viable method for determining the population growth of yeast because CO is a byproduct of the yeast's cellular respiration process. As more yeast cells are produced, more CO will be produced because there will be more cells to reduce the gas in the enclosed environment as they respire, as measured through the volume displacement method.

Yeast Population Growth Lab Report Essay Example

In this lab we will follow the growth of yeast populations in a habitat with differing conditions. Food concentrations for the yeast will be varied by changing the amount of sugar in the growth medium. We will also vary the concentration of ethanol in the medium, which tends to reduce the growth of yeast.

Thus, this method of determining population is called a sampling technique. Multiplying all average yeast cell counts in Table 1 by 1000 will give an estimate of the number of cells in the entire population. A volume equal to only 1/1000 the original yeast population was placed on the counting slides.

Biology Yeast Population Flashcards | Quizlet

Yeast cells have an average size of 5-10 μ m. In comparison to the size of a hemocytometer square (1mm), they are 100-200 times smaller. So you should count the smaller squares in this case (i.e., the ones in the central square, which measure 25 x 0.2mm). They also have helper lines that divide each of them into 16 even smaller squares.

Counting yeast with a hemocytometer • Hemocytometer

This belief also continued to hold up to our results because when a 6% molasses solution was used instead of water (our control) the yeast pop. went up, same when the molasses went from 6% to 12%....

Thus, yeast population growth should occur more slowly at cooler temperatures than at warmer temperatures. The yeast species used in both bread baking and the brewing of ales, *Saccharomyces cerevisiae*, thrives at temperatures between about 5 °C and 55 °C (about 40 °F to 130 °F).

Population Growth in Yeasts - Lesson - TeachEngineering

If the lab were to test a multicellular organism, it would take weeks or even months to get a proper result. Using yeast, the lab only took 72 hours. Furthermore, collecting CO₂ from the yeast is a viable method for determining the population growth of yeast because CO₂ is a byproduct of the yeast's cellular respiration process.
